Diabetic Foot and Vulnology Treatment & Research Center

#### **INTRODUCTION AND AIM**

This work is a challenge against the wounds that cannot heal without a surgical solution: the neoplastic ulcers. Especially in elderly people we try to avoid surgery, if possible; so we need a local treatment that tries to stop or slow proliferation, that can reduce infectious complication and bleeding and help epithelialization.

### **MATERIALS AND METHODS**

10 patients have been involved and terminated the observational time of 4 weeks; 7 of them achieved the end of follow up (12 months). We treated the wounds with a daily application of a spray powder containing silicon dioxide, ionic silver and chlorhexidine (SiO<sub>2</sub>-Ag+Chlorex)\*; non-adherent secondary dressing. After 4 weeks we evaluated wound area, infection signs and bleedings. Monthly follow up for 12 months.

<sup>\*</sup>KAdermin Spray Powder (Pharmaday Pharmaceutical)

## **RESULTS / DISCUSSION**

After 4 weeks we had no area change in 6 patients, a light reduction in 3 and a complete epithelialization in 1; no infections and only one bleeding, fully controlled with an alginate dressing for 24 hours. Actually no relapses, no worsening, no infections, two bleedings (the same patient) and 4 complete epithelialization.

Patients	1	2	3	4	5	6	7	8	9	10
FOUR WEEKS FOLLOW UP										
Wound Area	n.c.	-14%	n.c.	n.c.	n.c.	Epith.	n.c.	-33%	-37%	n.c.
Infection										
Bleeding				Х						
TWELVE MONTHS FOLLOW UP										
Wound Area	-29%	Epith.	-39%	-7%	n.c.	Epith.	-48%	Epith.	Epith.	n.c.
Infection										
Bleeding				X (2)						

Wound Area Reduction: 4/10 - Epithelialization: 4/10 - Bleeding: 1/10 - Infection: 0/10 **NO INDUCED PAIN** 

#### CONCLUSION

We all know that no dressing can heal a neoplastic lesion, but in case of non surgical treatment we can help patients reducing complications and giving a satisfactory quality of life.
